This item is printed on demand - Print on Demand Neuware - The dynamical properties of solids have recently attracted renewed interest in connection with the increasing understanding of phase transitions and related phenomena. In particular, soft modes or, more generally, phonon 'anomalies' seem to play an important role in structural and electronic phase transitions, such as ferroelectric or superconducting transitions. The understanding of the mechanisms responsible for the occurrence of unusually low frequencies in phonon spectra requires a detailed analysis of the microscopic forces governing the lattice vibrations. Of particular importance is the influence of the electron lattice interaction in the adiabatic approximation which in many cases is the origin of peculiarities in the phonon self-energy. In this work the vibrational spectra of pure non-metals and of those containing point defects are investigated. In these materials the interrelation between the pseudo-harmonic forces (determining the phonon dispersion relations) and the non-linear anharmonic and electron-phonon forces (as they act in infrared and Raman spectra) is most obvious and can be quantitatively analysed in terms of appropriate models. The main task is to arrive at...
